

Review from Turing

2022 review

-
- Luthfulahi Oseni made an impact to support Turing's growth by delivering Bulk Buy initiative in 2022 Q2, which improved overall fulfillment of bulk jobs and saw ~20% more jobs fulfilled QoQ in 2022 Q3 with continued incremental gains.
- He consistently proved his ownership quality; not only built the UI components for pre-shortlist but took complete ownership of delivering FE & BE as a fullstack developer, fixed any last minute issues before demo etc.
- He believes in executing fast with quality delivery and demonstrated it with pre shortlist, communication integration, complex filters in pre shortlist, etc.
- He breaks down the mid-size project into milestones & shows progress towards achieving those milestones, while unblocking himself with guidance from leads.
- He collaborates very effectively with other team members, cross-functional teams (comms, vetting) and stakeholders (QA, Product, Ops)
- A strong team player, shows leadership skills and also effectively lead the pod as scrum master effectively.

2023 review

Domain Knowledge

- Product 0-1: Oseni built an engagement tracking product (about to go live) single-handedly with minimal guidance from leads. He followed all engineering best practices, such as understanding requirements clearly, building a solid engineering design, demoing the early product, and working closely with the QA team.
- Product 1-10: Oseni already had a decent understanding of developer data at Turing and its integration with pre-shortlist. With developer service, he further sharpened this understanding to become a subject matter expert in this area and how it integrates across matching systems.

Impact

- Developer Service: Developer service is one of its kind at Turing and a pioneer project. It started with a mission of Unified DDP initiative but soon extended to support developer data across all matching and self-serve surfaces. Oseni not only extended the core functionalities of developer service to design batch API, but also integrated developer service to almost all the matching surfaces with extreme ownership. This has cut down engineering effort to half and also releasing new features almost every other day leading to execute fast goal at Turing.
- Engagement Tracking: Oseni in-progress (dev done) initiative of engagement tracking is expected to kill two Slack channels and one sheet of tracking

engagement feedback, improving the efficiency of fulfillment ops. This will be foundational to capture feedback through the product and share it with downstream teams to further impact.

- Product Quality: Oseni moved unit test coverage of developer service from single digit to ~50% coverage and is on track to further improve it this quarter, laying the foundation for an automated release with no or very little manual intervention.
- Skills API Latency: Skills API on DDP used to take ~9 seconds at spikes, which was reduced to ~2.5 seconds by doing significant optimizations to database queries fetching this data. This leads to a great customer experience on both matching and self-serve products.
